Pennate Diatom Flora of a Coldwater Mountain River, the Alaknanda: Suborder Raphidioideae and Monoraphideae

Rachna Nautiyal and Praakash Nautiyal
Zoology Department, HNB Garhwal University, Srinagar-246 176
(Accepted April 1996)

The Raphidiod and Monoraphid diatom flora of the Himalayan river Alaknanda were represented by 5 and 24 taxa, respectively. While *Eunotia* was the sole Raphidiod genera, the Monoraphids included *Cocconeis*, *Achnanthes* and *Rhoicosphenia*. *Achnanthes* alone accounted for 21 taxa while *Rhoicosphenia* and *Cocconeis* were represented by 2 and 1 taxa, respectively.

Key Words: Pennate diatoms, Alaknanda, Raphidioideae, Monoraphideae.

Freshwater diatoms have been extensively studied in some parts of India. According to Sarode and Kamat (1984), Gonzalves (1947), Gandhi (1956b, 1957a,c, 1958b, 1959c, 1960b, 1962a,b) and Thomas and Gonzalves (1965) have contributed immensely to diatom flora of Maharashtra. He has also enumerated a number of other authors (Eherenberg 1854, Dickie 1882, Skvortzov 1935, Singh 1939, 1961, 1962, 1963) who have contributed variously to freshwater diatom flora of India. However, the Himalayan rivers have been scantily investigated for their diatom flora, especially in case of the Ganga river system. The results presented herein pertain mainly to the Raphidiod and Monoraphid diatom flora of the coldwater river Alaknanda.

The samples for study were collected from 3 different locations within a 2 Km. stretch of the Alaknanda during 1991-92. Collections were preserved in 4% formalin. Brun’s method described by Sarode and Kamat (1984) was adopted for processing the sample and permanent mounts were prepared in Canada balsam for microscopic examination. Identifications were made according to Sarode and Kamat (1984) and Hustedt and Jensen (1985).

    Sarode & Kamat 1984, p. 59, pl. 5, f. 125 a,b.
    Valves 9-2 μm long and 2-2.5 μm wide; striae 23-24 in 10 μm.

28. **Rhoicosphenia curvata** (Kutz.) Grunow 1867
    Hustedt & Jensen 1985, p. 373, f. 879.
    Valves 13-25 μm long and 3.5-6 μm wide; striae 14-18 in 10 μm.

29. **Rhoicosphenia Vanheurcki** Grunow, 1881
    Valves 6-9 μm long and 2-3.5 μm wide; striae 14-15 in 10 μm.

**DISCUSSION**

The present study was a part of maiden attempt to record the diatom flora of a coldwater Himalayan river,
Pennate diatom flora of a cold water mountain river
the Alaknanda. In all, 173 pennate taxa of 23 genera,
belonging to 7 families of 4 suborders were recorded.
Of these, 30 taxa belonged to 5 genera of sub-order
Araphididae, family Fragilariaceae, 5 taxa to 1 genus
of sub-order Raphidinaceae, family Eunotiaceae and
24 taxa to 3 genera of sub-order Monoraphididae,
family Achnanthesaceae, thus amounting to 59 taxa of
9 genera. Rest 114 taxa belonged to 14 genera of sub­
order Biraphidaceae.

This contribution deals specifically with Raphidiod
and Monoraphid diatom taxa. In case of the former only
5 taxa (3 species, 2 varieties) of the genus
*Eunotia* were recorded during the study. Among the latter repre­
sented by 3 genera, *Achnanthes* was the only genera
with largest number of taxa (15 spp, 4 var, 3 forms). The other 2 Monoraphid genera
*Cocconeis* and *Rhoicosphenia* were represented by 1 var. and 2 spp. As
far as India and neighbouring countries are concerned,
a large number of freshwater Raphidiod and Monoraphid species have been reported (Sarode and Kamat 1984,
Foged 1971, 1976). In the Himalayan river Alaknanda
only *Achnanthes* was well represented, other genera
being very few. However, all the taxa recorded during
this study have been reported from European freshwa­
ter (Hustedt and Jensen 1985).
